

string data

Data consisting of an ordered sequence of character

Examples of strings

- "Hello"
- "123"
- "Number 1!"

Command `str()`

converts the input object into a string

Command `len()`

string concatenation

The process of joining two strings together

Method

A function that belongs to a specific data type

Command `.upper()`

Returns a copy of the string in all uppercase letters

Command `.lower()`

Returns a copy of the string in all lowercase letters

Index

A number assigned to every element in a sequence that indicates its position

Command . append()

ADDs input to the end of a list

Regular expression (regex)

A sequence of characters that forms a pattern

Command +

Represents one or more occurrences of a specific character

"a+" matches

- "a"
- "aaa"
- "aaaaa"

\w

Matches with any alphanumeric character but it doesn't match symbols

"\w" matches

- "1"
- "h"
- "i"

"\w+" matches

- "1q2"
- "abc123"
- "security"

`command re.findall()`

Returns a list of matches to a regular expression

Module 4

`Command with`

Handles errors and manages external resources

`command open()`

opens a file in python

~~convert~~

`command : read()`

converts files into strings

Parsing

The process of converting data into a more readable format

`command .split()`

converts a string into a list

Solving the problem

- for loop
- counter variable
- if statement

Debugging

The practice of identifying and fixing errors in code
