

Lab 3.3.12 Report: Windows Task Manager

Student Name: omar mohammad hamed

Objectives

- Explore Windows Task Manager functionality
 - Manage processes and monitor system resources
 - Understand different tabs and their purposes
-

Part 1: Working in the Processes Tab

Question 1: What is listed under Windows Command Processor heading?

Answer:

Command Prompt (cmd.exe) is listed under this heading, showing the active command line interface window.

Question 2: What is the filename and location of Console Window Host process?

Answer:

- **Filename:** cmd.exe
 - **Location:** C:\Windows\System32
-

Question 3: What happens when the command prompt window is closed?

Answer:

Both Windows Command Processor and Console Window Host disappear from the process list because the process has terminated.

Question 4: What effect does clicking the Memory heading twice have?

Answer:

- First click: Sorts processes by memory usage in descending order (highest first)

- Second click: Sorts in ascending order (lowest first)
-

Question 5: What effect does changing to Percent view have on Memory column?

Answer:

The memory values change from displaying megabytes (MB) to displaying percentage (%) of total memory used.

How could this be useful?

It makes it easier to quickly identify which processes are consuming the largest proportion of system memory without needing to calculate percentages manually.

Question 6: What happens when you double-click Microsoft Edge?

Answer:

The Microsoft Edge browser window comes to the foreground and becomes the active window.

Question 7: What happens when you select "End task" on Microsoft Edge?

Answer:

All Microsoft Edge browser windows close immediately, and the process is terminated.

Part 2: Working in the Services Tab

Question 8: What statuses are listed in the Services tab?

Answer:

Two statuses are displayed:

- **Running:** Services that are currently active
 - **Stopped:** Services that are not currently running
-

Part 3: Working in the Performance Tab

Question 9: How many threads are running?

Answer:

3142

Question 10: How many processes are running?

Answer:

214

Question 11: What is the total physical memory (MB)?

Answer:

8 GB

Question 12: What is the available physical memory (MB)?

Answer:

2 GB

Question 13: How much physical memory (MB) is being used?

Answer:

5.7 GB

Question 14: What is the link speed?

Answer:

1 Gbs

Question 15: What is the IPv4 address of the PC?

Answer:

192.168.1.26

Reflection Question

Why is it important for an administrator to understand how to work within Task Manager?

Answer:

Understanding Task Manager is crucial for system administrators because it provides:

1. **Real-time Monitoring:** Allows monitoring of CPU, memory, disk, and network usage to identify performance bottlenecks
2. **Process Management:** Enables quick termination of unresponsive or problematic applications without restarting the system
3. **Troubleshooting:** Helps diagnose system slowdowns by identifying resource-hungry processes
4. **Security:** Allows detection of suspicious processes that might indicate malware or unauthorized programs
5. **Service Management:** Provides control over Windows services, allowing administrators to start, stop, or restart critical system services
6. **Performance Optimization:** Helps identify programs that consume excessive resources and can be disabled or optimized
7. **System Health Assessment:** Provides quick overview of overall system health and resource availability

This tool is essential for maintaining system stability, security, and optimal performance in any IT environment.

Conclusion

This lab provided hands-on experience with Windows Task Manager, demonstrating its importance as a system monitoring and management tool. I learned how to monitor processes, manage system resources, and troubleshoot performance issues effectively.
